WH	1001	Floral Dress S	\$1,799.40	1,800	1	0.03%

Overview

This report reviews simulated seasonal buys against forecast to identify stock risk, margin exceptions, and planning actions for demonstration of skills.

The assortment is underbought versus forecast, creating the primary risk of missed sales. The recommended priority is to chase the largest deficits first, beginning with the **INT 1002 (-25)**, then **DTC 1001** and **DTC 1002 (-10)**, followed by the **-5 unit group**. If inventory exists in other warehouses for shared SKUs, evaluate reroute opportunities. From a profitability standpoint, **INT 1009 (-7.06%)** requires pricing/cost validation before increasing buys, while the near break-even styles (**0.03%**) should be monitored closely to prevent margin erosion.
